SKILLS

- C++
- Reverse Engineering (Cheat Engine, x64dbg, Ghidra)
- MinHook (Function Hooking)
- Git/GitHub

EDUCATION

- [Videogame Designer](#)
Instituto Profesional Arcos
2021-2025

LANGUAGES

- Spanish (native)
- English (intermediate)

ABOUT ME

C++ systems programmer, with experience on building mods with DLL proxy injection, function hooking via MinHook and reverse engineering using Cheat Engine, x64dbg and Ghidra.

PERSONAL PROJECTS

Artemis (April 2026 - Present)

This project aims to train an AI agent for combat in Halo Reach (MCC). However, the bulk of the project is the extraction, reinterpretation, and delivery of real-time game data: from reading object and player tables, through semantic reconstruction of that raw data, to producing a custom tick containing everything relevant for AI training.

AutoTheater (October 2025 - April 2026)

AutoTheater-MCC automates camera direction in Halo Reach (MCC)'s Theater mode, aiming to always show the most interesting action happening at any given moment during a match replay. It also includes a replay file manager for saving and loading replays across all Halo: The Master Chief Collection titles, plus a built-in recording system using FFmpeg.

WORK EXPERIENCE

UE Developer (November 2022- March 2023)

My internship at **Arcadius Entertainment** started as a game mechanics programmer to transition into a technical designer role, focusing on documenting game mechanics.
